### **BedRock Announces: New Operating Manual & Demonstration Module**

BedRock Software, Inc. (BedRock) announces the development and release of a new Operating Manual and Demonstration Module for the AggFlow plant simulation program.

“The new support and education systems will help our users and prospects get the most out of AggFlow. Most of the questions we receive from users and interested parties pertain exactly to the items these two new developments address” said Amy Mick, Business Manager for BedRock Software.

The operating manual is actually imbedded in the program under the HELP menu. Therefore, it is instantly available to program users. Furthermore, many of the working menus in the program contain a ‘help’ button that takes the user directly to the appropriate page of the operating manual for that topic. The newly revised demonstration version is available to interested parties upon request.

AggFlow, the industry standard plant optimization software program, is used by aggregate producers, equipment manufacturers and dealers around the world to reduce calculation time and increase productivity in aggregate and mining operations. Visit the AggFlow website for more detailed information at: [www.aggflow.com](http://www.aggflow.com)

**BedRock Software, Inc.** has been providing the AggFlow program to the aggregate industry since 1993. BedRock is an independent, privately held company.
